

## Problem Set 1 Exercise #10: Three Integers

**Reference:** Lecture 2 notes

**Learning objective:** Writing methods

**Estimated completion time:** 20 minutes

### Problem statement:

Write a program **PS1\_Ex10\_TheeInts.java** that reads in 3 positive integers and prints out digits at the respective hundredth position, each separated by a space.

Your program should contain a method **getHundredth()** that accepts an integer and returns the digit in its hundredth position. If a given integer is less than 100, its hundredth position can be viewed as 0. Note that there should be no input/output statement in this method as this method is solely for computation purpose. The **main()** method is responsible for data input/output.

### Sample run #1:

```
Enter 3 positive integers: 234 509 633
2 5 6
```

### Sample run #2:

```
Enter 3 positive integers: 12156 6344 95
1 3 0
```
